

L 13347-63

ACCESSION NR: AP3002899

degasification rate with a given period of time as is inversely proportional to the square root of the residual pressure in the chamber. In the kinetic region of the degassing process, a reduction in the amount of residual pressure in the chamber is accompanied by a large rise in the degassing rate. It is not too large in the mixed region and very small in the diffusion region. In the case of a prolonged vacuuming, the hydrogen content in steel is practically identical for all amounts of residual chamber pressure. Orig. art. has: 6 figures and 13 formulas.

The regions around the Uzbek SSR, the Tadzhik SSR, and the mountains of Caucasia and Altay are rich in mountain streams, which are a good source for electrical power. The author sees no reason why these cannot be adapted for supplying power to radio and telephone stations. He states his argument briefly and concludes by saying that in 1947 there will be sufficient technicians to put this plan into operation by constructing hydro-equipment.

AUTHOR: Kurochkin, L.I., Engineer

TITLE: Television for cranes

PERIODICAL: Mekhanizatsiya i avtomatizatsiya proizvodstva, no. 11, 1960,  
39

TEXT: A report is given on an experiment with a ПТУ-0 (PTU-0) TV-camera on a tower crane in 1959. The experiment had been carried out by Upravleniye No.67 tresta mekhanizatsii stroitel'nykh rabot Leningrada (Directorate No.67 of the Trust of Construction Work Mechanization of Leningrad) in cooperation with the Television Department of Leningradskiy elektrotekhnicheskii institut svyazi (Leningrad Electrotechnical Institute of Communications). The C-419 (S-419) crane was used in the erection of a 5-storied house. The receiving screen was placed in the operator's cabin (Fig.2), the transmitter camera on the jib, 3m from its end (Fig.1). The receiver tube 35ЛК 2Б (35LK2B) is at the same time the feed source of the camera, and the transmitter tube was a "vidikon", the most suitable type for low-skill personnel. The control is on the receiver. The receiver and

Card 1/4

Television for cranes

S/118/60/000/011/011/014  
A161/A133

transmitter were connected by three cables - two coaxial and one screened multicore cable. The power consumption was not above 250w with a 220v network; the weight of the transmitter was 4 kg and of the receiver 32 kg. The manual focusing and diaphragm setting are the drawback of the industrial PTU-0. The transmitter camera was hinged to the jib to prevent deflection of the optical axis at jib movements. The objective was a "Yupiter-12" (F = 3.5 cm). The Directorate will provide 15 tower cranes with TV sets in 1961. An editorial note says that ~~NTM~~ -OM1 (PTU-OM1) TV sets being produced in 1961 are free of the drawback mentioned in the PTU-0. There are 2 figures.

TITLE: Manufacturing bimetallic bushes using h-f currents

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 3, 1962, 24, abstract 3G166. (V sb. "Avtomatiz. i mekhaniz. v mashinostr." Saratov, 1960, 15-17)

TEXT: The bimetallic bush blank is a steel sleeve of low-carbon steel which is filled with bronze chips and flux. The bronze grade is chosen taking into consideration the operating conditions of the bearing. Borax is used as flux (1.5 - 2% of the weight of the filled-in bronze). The sleeve filled with bronze and flux and covered at the ends with two lids, is placed into the inductor and fixed in the center of the installation. The sleeve is heated by h-f current to a light-red color. Then a motor is switched on and the sleeve, rotating at a speed of 1,200 rpm, is heated until the bronze is molten. This process takes 5 - 15 minutes. After the fusion, the h-f current is switched off, while the sleeve continues to rotate, cooling gradually. The production of bimetallic bushes by the method described makes it possible to cut the labor consumption

Card 1/2

Manufacturing bimetallic bushes using h-f currents

A004/A101

and accelerate their manufacture; moreover, it is possible to considerably lower the consumption of nonferrous metal, both by replacing bronze by steel and by using ferrous metal waste - bronze chips. There is 1 figure.

SOV/84-59-9-30/66

AUTHOR: Kurochkin, N., Chief Engineer for Inventions

TITLE: A Saving : 6,000,000 Rubles

PERIODICAL: Grazhdanskaya aviatsiya, 1959, Nr 9, pp 18-19 (USSR)

ABSTRACT: This is a survey of the principal improvements and inventions made by Aeroflot personnel in the fields of automation, improvement of aviation materials, mechanization of labor-consuming work processes and in the equipment used by the Aviatsiya spetsial'nogo prime-neniya (Aviation for Special Assignments). The implementation of only 14% of the submitted proposals and inventions has saved the country over 6,000,000 rubles. Efficiency experts of the Severo-Kavkazskoye upravleniye (North-Caucasian Administration) N. Zhirnov, V. Petrov-skiy and Z. Keller in 1954-56 worked out a system of complex automation and remote control of equipment used in landing control. In 1957, the installation directed by I. Ivasik constructed an automatic ma-

Card 1/3

SOV/84-59-9-30/66

A Saving: 6,000,000 Rubles

chine for washing aircraft engine parts. In 1958, the installation directed by Kh. Izmiryan constructed an automatic line for washing aircraft engine parts. Efficiency experts V. Ferenets, Ye. Vishnyak and V. Pinchuk also worked out a semi-automatic line for washing the aircraft and the aircraft engine parts. Efficiency experts and inventors of the GosNII GVF S. Ochkov, M. Shtern V.II'chishin, Ye. Krivousova and I. Markov improved an apparatus of the glide path landing control system. Inventors Baranovskiy and Khaymovich worked out an attachment to the aircraft special equipment enabling Soviet aircraft to land on foreign airports with the use of the ILS method of landing. Inventor G. Protasov invented an instrument "Signalizator vysoty" (Altitude Signalizer) warning the pilot, by light and by sound, of having reached a dangerous altitude of descent, when flying over precision approach localizers. This instrument has been put into serial production and is installed

Card 2/3

SOV/84-59-9-30/66

A Saving: 6,000,000 Rubles

in every airplane. Inventors P. Ivanov, B. Khristenko, P. Oshkin and M. Koshevoy have worked out a tire-stripper for the Tu-104, Il-14, and other aircraft, which will be used in all units of Aeroflot. Efficiency experts A. Epshteyn, N. Pantegov, S. Tsimbalyuk, S. Aranin and G. Ushakova have constructed a self-propelled X-ray laboratory for X-raying hermetic aircraft cabins. Inventor A. Lebedev invented a power testing installation for helicopter power units. Inventors S. Popov, P. Baranov, D. Yepisheva and S. Kalibernov invented a special duster of poisonous chemical powders for An-2 aircraft, put into production. Efficiency experts of the Ukrainskoye Upravleniye (Administration) Konovalov and Lagutochkin constructed a loader of loose chemicals, for the An-2 aircraft. ✓

Structure of 1,6-dioxaspiro[4.4]nonane. A. A. Potomarev, V. A. Aland, and N. I. Kurchik. *Doklady Akad. Nauk S.S.S.R.* 87, 183-6 (1952); cf. Burdick and Adkins, *C.A.* 28, 4055; Farlow, *et al.*, *C.A.* 29, 775. Condensation of AcH with 5-methylfurfural gave 28% 3-(2-methyl-5-furyl)-2-propenal, *b*<sub>p</sub> 95-100°. This hydrogenated over Cu chromite catalyst at 120° and 120-35 atm. in EtOH gave 75% 3-(2-methyl-5-furyl)-1-propanol, *b*<sub>p</sub> 97-9°, *n*<sub>D</sub><sup>20</sup> 1.4775, *d*<sub>4</sub><sup>20</sup> 1.0322, which, hydrogenated over Ni-kieselguhr at 150 atm. and 120° in EtOH, gave 2 products: 3-(2-methyl-5-tetrahydrofuryl)-1-propanol, *b*<sub>p</sub> 111-13°, *n*<sub>D</sub><sup>20</sup> 1.4635, *d*<sub>4</sub><sup>20</sup> 0.9972, and 2-methyl-1,6-dioxaspiro[4.4]nonane, *b*<sub>m</sub> 162-4°, *n*<sub>D</sub><sup>20</sup> 1.4412, *d*<sub>4</sub><sup>20</sup> 0.9920, *n*<sub>D</sub><sup>20</sup> 1.4424 (15.8% yield) (cf. Alexander, *et al.*, *C.A.* 46, 1535). Me<sub>2</sub>CO and 5-methylfurfural gave 4-(2-methyl-5-furyl)-3-buten-2-one, *b*<sub>p</sub> 105.5-7.0°, *m*. 35-6°. This hydrogenated over Cu chromite at 89-95 atm. and 120° in EtOH gave 80.5% 4-(2-methyl-5-furyl)-2-butanol, *b*<sub>p</sub> 130.5-8.0°, *n*<sub>D</sub><sup>20</sup> 1.4760, *d*<sub>4</sub><sup>20</sup> 1.000, which hydrogenated over Ni-kieselguhr at 130-40 atm. and 120° gave: 73.6% 4-(2-methyl-5-tetrahydrofuryl)-2-butanol, *b*<sub>p</sub> 134-0°, *n*<sub>D</sub><sup>20</sup> 1.4542, *d*<sub>4</sub><sup>20</sup> 0.9574, and 3.1% 2,7-dimethyl-1,6-dioxaspiro[4.4]nonane, *b*. 107-0°, *n*<sub>D</sub><sup>20</sup> 1.4389, *d*<sub>4</sub><sup>20</sup> 0.9594, which gives a positive Tollen test. These results indicate that the hydrogenation of furan aldehydes leads to tetrahydrofuran alcs. which on further hydrogenation either yield satd. furan alcs. or the spiro derivs. Thus, hydrogenation of furfurylideneacetone and 3-(2-methyl-5-furyl)-2-propenal should yield 2-methyl-1,6-dioxaspiro[4.4]nonane, along with the satd. furan alcs., confirming the identity of the 2 five-atom rings in such compds. which is possible only in spiro derivs.

AUTHORS: Redoshkin, B. A., Shushunov, V. A., Kurochkin, N. I.  
TITLE: Oxidation kinetics of cyclohexyl benzene by oxygen  
PERIODICAL: Referativnyy zhurnal, Khimiya, no. 11, 1961, 62-63, abstract  
116451. (Tr. po khimii i khim. tekhnolog. (Gor'kiy), 1960, vyp.  
1, 3-8)

TEXT: The rate of oxidation of cyclohexyl benzene (I) does not depend on the pressure  $p$  of  $O_2$  at  $p > 200$  mm Hg and on the initial amount of (I); with temperature increasing from 115 to 140°C, it grows rapidly. The apparent activation energy of the gross process is equal to 24 kcal/mole. The yield in hydrogen peroxide of (I) drops during the reaction which, in the authors' opinion, indicates the presence of induced decomposition of the hydrogen peroxide of (I), as well as an acceleration of its thermal decomposition under the action of the decomposition products.

"Significance of Pressure Losses in Gas-Turbine Combustion Chambers," N. N. Kurochkin, 4 pp

"Energet Byul" No 10

Generation of hot compressed gases in combustion chambers is associated with pressure losses, caused by aerodynamic effects of mixing primary air with fuel and mixing combustion products with cooling air and by friction and local resistances. These pressure losses reduce power of installation. Shows that, when gas temperature before admission to turbine is 650-750° C (most commonly used) a 1% pressure loss will cause a 2.0-2.5% drop in efficiency.

ACCESSION NR: AP4042792

S/0020/64/157/003/0577/0579

AUTHOR: Kurochkin, N. V.

TITLE: Effect of mechanical properties of materials on the productivity and specific energy in ultrasonic working

SOURCE: AN SSSR. Doklady\*, v. 157, no. 3, 1964, 577-579

TOPIC TAGS: ultrasonic machine tool, ultrasonic grinding, metal removal, mechanical property

ABSTRACT: Results are presented of an investigation of the dependence of the productivity and energy consumed (per cubic millimeter of material destroyed by ultrasonic working on the mechanical properties of the worked material). Ultrasonic working was done in a benzene suspension (to avoid the adsorption of active components of the medium) of boron carbide at a tool frequency of 18.5 kcs and an amplitude of 21 microns, and under a tool compression force of 1 kg.

Card 1/4

ACCESSION NR: AP4042792

The tool was a 5 mm cylindrical end piece of silver steel. Tests of various materials under different conditions have shown that the productivity and specific energy of ultrasonic working of solids depends mostly on the brittleness. The higher the brittleness, other conditions being equal, the greater the productivity and the lower the energy. The higher the ultimate strength of the material, the lower the energy and the lower the productivity. Orig. art. has: 2 figures, 1 formula, and 2 tables. Report presented by P.A.Rebinder.

AUTHORS: Kurochkin, N. V.; Likhtman, V. I. 44,55 50 44 B

TITLE: Influence of surface-active substances on processes occurring in ultrasonic metal finishing 4

SOURCE: AN SSSR. Doklady, v. 162, no. 3, 1965, 549-551

TOPIC TAGS: surface active agent, ultrasonic machining

ABSTRACT: The authors investigated in detail the influence of different surface-active substances and the efficiency of ultrasonic metal finishing, depending on the nature of the substances, on the orientation, the type of solvent, the temperature, and viscosity. The metals investigated were copper, aluminum, iron, nickel, zinc, and lead, in pure form. The experiments were carried out at 18.5 kos and an amplitude of 23  $\mu$ . The tool used was a silver steel cylindrical indenter 5 mm in diameter. The surface active substances were oleic, capric, and enanthic acids and decyl and butyl alcohol, and the solvents were benzene, mineral oil, and undecane. The abra-

Card 1/4

L 103 16

2

sive was finely powdered boron carbide. A typical plot of the relative amount  $V/V_0$  of metal removed by ultrasonic means ( $V$  -- metal removed in milligrams per minute in an active medium,  $V_0$  -- in pure solvent) against the concentration of the active component (acid) is shown in Fig. 1 of the Enclosure and is typical of all tested metals except lead, for which the productivity decreases somewhat in the presence of surface-active substances. The results are interpreted in light of the effect of the molecules from the carbon chain of the adsorbed surface-active material on the friction between the abrasive and the metal. The distinctive behavior of lead is attributed to its easy recrystallization.<sup>4</sup> The temperature dependence of the effect was also studied and the results show that the maximum effect of the surface-active substances occurs at 35 -- 40°. Neither the frequency (10 -- 20 kcs) nor the amplitude (23 -- 38  $\mu$ ) exerted a noticeable influence on the finishing process. This report was presented by P. A. Rebinder. Orig. art. has: 2 figures.
